### Site Description

## Description Text

[Share](#)

The New Jersey Zinc/Mobil Chemical site is located in the village of DePue, Bureau County, Illinois. The historic manufacturing site consists of approximately 950 acres within the corporate limits of the Village of DePue and constitutes roughly one-half of the village land mass. Delineation of the extent of contamination from the facility will be completed as the Remedial Investigations (RIs) proceed and may include over four square miles (2560 acres) within and surrounding the Village. All the privately- and municipally-owned properties within the Village, over 100 acres of land owned by the Illinois Department of Natural Resources (Illinois DNR), all of DePue Lake (reported by Illinois DNR to be in excess of 685 surface acres) and additional privately-owned properties outside the corporate limits of the village will likely be included in the delineation studies to establish the extent of contamination. The site has been the location of primary zinc smelting, sulfuric acid manufacturing, paint pigment production, ammonium phosphate fertilizer manufacturing, refining and recovery of secondary metals from zinc ore (i.e., cadmium), secondary zinc smelting and zinc dust production. The site was originally developed in 1905 as a primary zinc smelter by the Mineral Point Zinc Company and was operated continuously in various capacities until 1989. Between 1905 and 1989, portions of the site were owned and operated by the New Jersey Zinc Company, the Mobil Oil Corporation, Gulf & Western Industries, Horsehead Industries and the Zinc Corporation of America. Through various corporate mergers and acquisitions, responsibility for the site has fallen to Viacom International Incorporated, ExxonMobil Corporation, and Horsehead Industries. These three companies have formed an entity known as "The DePue Group," which collectively represents the potentially responsible parties (PRPs) for the site. Through enforcement of the Clean Air Act and the Clean Water Act, the Illinois **NOTE: More Description Text Exists. Click [here](#) to see a complete description report.**

---------------------------	---------	-------------------	--

**Description Text**

The New Jersey Zinc/Mobil Chemical site is located in the village of DePue, Bureau County, Illinois. The historic manufacturing site consists of approximately 950 acres within the corporate limits of the Village of DePue and constitutes roughly one-half of the village land mass. Delineation of the extent of contamination from the facility will be completed as the Remedial Investigations (RIs) proceed and may include over four square miles (2560 acres) within and surrounding the Village. All the privately- and municipally-owned properties within the Village, over 100 acres of land owned by the Illinois Department of Natural Resources (Illinois DNR), all of DePue Lake (reported by Illinois DNR to be in excess of 685 surface acres) and additional privately-owned properties outside the corporate limits of the village will likely be included in the delineation studies to establish the extent of contamination. The site has been the location of primary zinc smelting, sulfuric acid manufacturing, paint pigment production, ammonium phosphate fertilizer manufacturing, refining and recovery of secondary metals from zinc ore (i.e., cadmium), secondary zinc smelting and zinc dust production. The site was originally developed in 1905 as a primary zinc smelter by the Mineral Point Zinc Company and was operated continuously in various capacities until 1989. Between 1905 and 1989, portions of the site were owned and operated by the New Jersey Zinc Company, the Mobil Oil Corporation, Gulf & Western Industries, Horsehead Industries and the Zinc Corporation of America. Through various corporate mergers and acquisitions, responsibility for the site has fallen to Viacom International Incorporated, ExxonMobil Corporation, and Horsehead Industries. These three companies have formed an entity known as "The DePue Group," which collectively represents the potentially responsible parties (PRPs) for the site. Through enforcement of the Clean Air Act and the Clean Water Act, the Illinois EPA and the United States Environmental Protection Agency (U.S. EPA) have had extensive involvement at the site. Many violations of both state and federal environmental regulations were investigated by both agencies. The violations and resulting investigations are beyond the scope of this document and are not enumerated herein. In 1987, the U.S. EPA evaluated the site under the guidelines of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, as amended (CERCLA or Superfund) and determined that the site did not qualify to placement on the National Priorities List (NPL). However, the placement criteria were modified by the Superfund Amendments and Reauthorization Act of 1986 (SARA). In 1992, the Illinois EPA reevaluated the site for NPL placement under the new criteria. The site was subsequently proposed for inclusion on the NPL on April 1, 1997 and the listing was finalized on June 9, 1999. In 1992, the New Jersey Zinc site was the subject of an Expanded Site Investigation conducted by the Illinois EPA. The main areas of contamination discovered at the site were: a waste pile containing in excess of one million tons of primary zinc smelter slag; several waste piles of paint pigment production waste estimated to contain in excess of 200,000 tons of material; the plant property containing the historic processing areas; and various impacted off-site properties. Based on the results of the investigation, an Interim Consent Order (ICO) between the State of Illinois and the DePue Group was negotiated. This ICO was entered in the Circuit Court for the Thirteenth Judicial Circuit Bureau County, Illinois on November 6, 1995. The ICO requires immediate response actions such as enhanced site security, dust control and air monitoring, and control and treatment of certain groundwater and surface water releases. The ICO also requires several Remedial Investigation and Feasibility Studies (RI/FS), design of all remedies, and the implementation of selected remedies (i.e., the phosphogypsum waste pile which exceeds 160 acres closure of the small vanadium pentoxide disposal area, and completion of the selected remedy for the South Ditch unnatural sediments). The ICO does not contain a commitment for ultimate site-wide remedial action, but instead, envisions a subsequent order to drive final site wide activities. Specific to this Record of Decision (ROD), the ICO requires an RI/FS and a Remedial Design and Remedial Action (RD/RA) of the site area known as the South Ditch (South Ditch Operable Unit (OU) 1). An additional substantive requirement of the ICO was for the DePue Group to take measures to reduce or preclude discharges of metals-contaminated groundwater to surface waters of the state. At the time of entry of the ICO, the South Ditch received discharges of contaminated groundwater and surface water from the site. These discharges resulted in unnatural sediment, with high concentrations of heavy metals being deposited in the South Ditch. After the entry of the ICO, the DePue Group constructed an Interim Water Treatment Plant to collect and treat the sources of the metals-contaminated sediment. Operation of the Interim Water Treatment Plant will preclude future deposition of metals-contaminated sediment and has substantially reduced the potential for discharges of contaminated groundwater to surface water. This Interim Action ROD describes the action that will address the mobile sediments contained in the South Ditch and is based on the RI/FS results and a DePue Group contractor proposal. This action is not considered to be the final action in the area surrounding the South Ditch, but is rather the sequestration of potentially mobile, contaminated material in the Illinois River flood plain. The South Ditch is fully within the 100 year flood plain and most of the area is within the annual flood plain of DePue Lake, with water levels controlled by those in the Illinois River. This area of the site can reasonably be expected to remain a wetland setting. Any future land use will likely be determined more by the physical geographic setting than by residual contamination. Any residual contamination remaining after this interim action will be assessed during the OU 5 component of the RI. If necessary, remedial alternatives will be proposed in subsequent Feasibility Studies and will be selected through the Proposed Plan and ROD process. An interim ROD addressing OU 1 was completed in September 2004.
